

IMPORTANT NOTICE

Pictorial 3 in the manual and large insert sheet is in error. The line cord should be connected to tube socket D5 and to 110 volt socket F1 instead of D5 and F2 as originally shown. The correct wiring at this point is shown below.

At tube socket E, a 470K resistor is shown connected between socket ground lugs E10 and E11. The resistor should be connected between E10 and E5 as shown below. The step-by-step procedure and schematic are correct and should be followed in all cases.

Check these two corrections against pictorials 3 and 5.
